The invention relates to a method of surveying the CC (beta) chemokine receptor (CCR) genotypes in a population. The method is particularly applied to the human CCRS and CCR2 genes located on chromosome 3p21-22, which encode co-receptors for HIV-1. The method involves obtaining genomic DNA samples from a representative number of individuals within a population; combining each sample with experimental and control primer combinations to produce primer-annealed DNA; amplifying the DNA to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Surveying CC beta chemokine receptor (CCR) genotypes in population, involves amplifying genomic DNA of individuals with experimental and control primer combinations, size-separating amplicons and determining

streptococcal M proteins comprising N-terminal peptide fragments of M proteins that elicit opsonic antibodies against multiple serotypes of group A streptococci (e.g., Streptococcus pyogenes). The antibodies generated using the hybrid proteins are against one or more M protein serotypes, where at least one of the serotypes is MJ, MJ8 or MJ9. The invention also encompasses a recombinant DNA molecule comprising a nucleotide sequence that encodes a multivalent hybrid M protein; and a method for immunisteng a mammal against streptococcal infections, comprising administering an immunogenic multivalent hybrid M protein to the mammal. The multivalent hybrid M protein to spesonic or protective antibodies to the M proteins of different

produce amplicons; separating the amplicons by size; determining the genotype based upon the presence of CCR alleles; and compiling the genotypes determined. The method is particularly applied to the human CCRS and CCRS and CCRS are associated with a variation in the susceptibility of an individual to infection by HIV-1, or with a variation in the disease c progression of AIDS after infection. The invention specifically claims the experimental PCR primers AAF76112, and the control PCR primers AAF76114 for surveying CCRS and CCR2b genotypes. The method of the invention fulfils a longstanding need for the development of a rapid and informative genotyping strategy that can readily applied to analyse CCRS, CCR2 and related genetic variants, and disease progression. The present sequence repersents a human and disease progression. The present sequence represents a human and disease progression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 19 BP; 6 A; 4 C; 5 G; 4 T; 0 other;

This is the nucleotide sequence of a claimed DNA primer, designated delta-32 inv. which can be used for the amplification of HIV-1 CCRS co-receptor nucleic acids. It corresponds to nucleotide 955 of wild-type CCRS cDNA (see AAV84126). 4 Pairs of primers (see AAV84127-34) are provided. These can be used in claimed methods for detecting and identifying the presence of a CCRS variant in a sample. Primer pair delta-31 inv and delta-32 sens (see AAV84127) are particularly useful in detecting the presence of variant CCRS-delta32 (see AAV84159) that contains a 32 bp deletion when

This sequence is a PCR primer for DNA encoding an epitope-tagged TATA-box binding protein (TBP) that is expressed by the transgenic non-human animals of the invention. The animals are used to produce TBP. TBP is used to isolate and characterise higher-order transcription complexes (from different tissue and cell types, optionally at different developmental stages). It is also used to identify new and/or specific. TBP associated factors (TAFs, e.g. transcription factors, activators or inhibitors) and TAF-interaction factors, and to raise antibodies against TBP. The TAFs may be useful for regulating gene expression.

C. e.g. disease-related genes, so are potential pharmaceuticals, also for identifying human analogues for use in drug screening. The antibodies are used for affinity purification of TBP and its complexes. TBP can isolate transcription complexes from a wide variety of different tissues and calls (contrast known methods that are limited to isolation from a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This primer corresponds to a region 550 bp downstream of the ATG initiation codon of human Bob (see AAX0792), a new HIV/SIV traslocation promoter agent which acts with CD4 to serve as a receptor for retroviral entry. It was used with an upstream primer (see AAX07297) in the RT-PCR amplification of lymphocyte RNA. Bob mRNA was detected in PHA-stimulated peripheral blood monounclear cells (PMBC), purified T cells, and weakly in monounclear cells (PMBC), purified T cells, and weakly in monoucytes and B cells. Human, African green monkey and pig-tailed macaque genes (see AAX072894) encoding 2 receptors, termed Bonzo and Bob (see AAW9778-88), that are associated with retroviral entry into cells have been identified. Diagnostic and therapeutic uses of these novel translocation promoting agents are provided, and unitidial agents for treatment

The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA6619 to AAA6692. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Types I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes involved in genetic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New radiation hybrid map of the dog, Canine familiaris, genome, useful for e.g. identifying genes implicated in phenotypic and behavioral traits or in genetic diseases and for studying dog pedigrees
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAO52616-28 are primers which were used in the generation of pRK 5.1 human hepatocyte growth factor (huHGF) varient molecules. The amplification products from these reactions were cloned in E. coil cells and were then used to transfect human fetal kidney 293 cells. The expressed proteins were used to study the ability of huHGF to induce DNA synthesis of hepatocytes in primary culture. The expressed proteins may be used as first and/or second ligands in a conjugate for receptor activation. These conjugates may be used to activate the respective receptors and thereby mimic the biological activity of the corresponding native ligand.
                                                                                                                                                                                                                                                                                                                                                                                                  Activation of receptors, partic. of growth factors - using conjugate of two ligands capable of binding to receptors, for mimicking biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 30 BP; 7 A; 7 C; 4 G; 12 T; 0 other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                              ö
                      The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic autisense taisorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the

Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning.
A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer these, 277 were mapped by in situ hybridisation, somatic cell hybrid analysis (using the "primer" program available from E.Lander, MIT).
The STSS and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis to both. Using this method, 370 STSS specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping method is useful for the completion of high density sequence—based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones.
See AAQ82001-Q82706 and AAQ91325-Q91358 for STS primers.

                                                                                The present invention describes an assemblage comprising two primers, each of which can be used to amplify the intergenic spacer region IGS1 from one of various strains of the yeast Cryptococcus neoformans. A number of primers and probes are provided, as are the sequences of the IGS1 for 91 C. neoformans strains. This is useful in the discrimination of pathogenic yeasts, and the sequences can be used to construct a database having the same purpose. The present sequence is a probe or
comprises two universal primers adapted for nucleic acid amplification
                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Primer 5 and primer 6 (see AAV28524) are designed to amplify a 481 nucleotide DNA fragment initiating 265 nucleotides upstream of the polyA tail of RNA2 of a blackcurrant reversion virus (BRV) Finnish isolate genome (see AAV28525). They were used with primer 1,2 (see AAV28521-22), designed to amplify a 210 nucleotide fragment, to detect different isolates of BRV originating from widely different geographic locations. Primer pair 1,2 amplified the expected virus-specific fragments from all tested virus isolates, and the primer pair 5,6 amplified the expected virus isolates, and the nearly all the tested virus isolates, indicating that the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Blackcurrant reversion disease; BRV; rna2; diagnosis; Ribes; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Blackcurrant reversion virus RNA2 3' proximal fragment primer 5.

PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99528 and AAT9952. Claimer pair comprises the primers given in AAT99529. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cells far a colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor CDNA or mRNA (see also
                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining whether an individual has metastasised colorectal cancer cells and origin of tumour cells - by detecting presence of heat-stable toxin receptor on cells in a sample
sequences detecting by these primer pairs are well conserved in all 1solates, including the common (E) and strong (R) forms of the reversion disease. The invention provides methods and kits for the diagnosis of blackcurrant reversion disease using RT-PCR.

The components may be present in cis (in a single agent) or in trans (in separate agents).

The system is used for production of AAV vectors, particularly for gene therapy. The foreign DNA may encode a therapeutic protein, e.g. interferon, interleukin, growth factor, coagulation factor or metabolic enzyme, particularly one that increases the immunogenicity of tumour cells, and/or a diagnostic protein. The system produces AAV vectors on a large scale. It is based on the discovery that the rep68 and 78 proteins interfere with replication of AAV DNA, and that this interference is overcome by delaying

Target oligonucleotides AAV82665-68 were designed to hybridise to the detector oligonucleotide of the invention. The detector oligonucleotide of the invention. The detector oligonucleotide of comprises a single-stranded target-binding region and an intramolecularly base-paired secondary structure linked to two dyes (donor and acceptor fluorophores). In the secondary structure, fluorescence of the donor is quenched, but when it is linearised or unfolded a change in some fluorescence parameter becomes detectable. A target nucleic acid is detected by hybridizing it to a detecteor oligonucleotide in which the secondary structure is 5' to the target binding region, primer extension to produce a complementary strand using the secondary structure as template, resulting in linearization or the oligonucleotide are used to detect (by primer extension and oligonucleotide are used to detect (by primer extension and hybridization) and amplify (as signal primer) target sequences, e.g. for

Sequences AAA72437, AAA72449-A72461, AAA72468 and AAA72474-A72477

represent CDNAs encoding novel plant isoflavone synthases (AAB21052 and AAB21071). Also discibsed is the soybean cytcohrone P450

concoxygenase CYP93C1, encoded by a known sequence (AAA72444, NCBI No. 2739005), which was identified in the present invention as having isoflavone synthase activity. The invention also relates to expression constructs, transformed host cells, and transgenic plants and seeds conscribing the novel CDNA sequences of the invention. The invention also encompasses methods of altering isoflavone synthase expression in a host cell, altering isoflavoned in a limit, and identifying nucleic acids encoding other plant isoflavone synthases. Isoflavone synthase catalyses cell, altering isoflavonold levels in a plant, and identifying nucleic acids encoding other plant isoflavone synthases. Isoflavone synthase catalyses cells as Ney Tole in the biosynthesis of isoflavonolds. Isoflavonolds are catas of secondary metabolites mainly produced in leguminous plants by a branch of the phenylpropanold pathway. Isoflavonolds are consumptant of the synthesis of isoflavonolds. Isoflavonolds in the defence response of legumes against phytopathogenic intermediates to the synthesis of isoflavonolds. Isoflavonolds consumption of legume sand rhizobial bacteria which eventually result in nodulation and nitrogen fixation. They have also been shown to act as artibiotics, repellents, attractants, and signal compounds, and consumption of legume isoflavonolds sis associated with health benefits in humans. The novel isoflavonolds sis associated with health benefits in humans. The novel isoflavonolds signal compounds, and consumption of legume souch as soybean, and for the production of isoflavonolds in elegumes such as soybean, and for the production of isoflavonolds in clegumes such as soybean, and for the production of isoflavonolds consumption of the invention to ampility DNA encoding soybean chalcone consumption of the invention to ampility DNA encodi
                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding isoflavonoid synthases, useful for producing transgenic plants with increased production of isoflavonoids which are involved in defense against phytopathogenic microorganisms \,
                                                                                                                                                                                                                                  Fader GM, Jung W, McGonigle B, Odell JT,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30 nucleobases in length that are capable of inhibiting the expression of anotheronal pytuvate carboxykinase-cytosolic (PEPCK cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence is one of a number of antisense compounds of up to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense compound capable of modulating the expression of phosphoenol pyruvate carboxykinase-cytosolic, useful for preventing or delaying infection, inflammation or tumor formation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Soybean; chalcone reductase; phenylpropanoid pathway; isoflavone synthase; isoflavonoid biosynthesis; defence response; attractant; repellant; signal compound; antibiotic; transgenic plant;

AAT AAT37933-T37946 represent the intron/exon boundaries for the human vascular endothelial growth factor (VEGF) proteins of the invention (see AAW04829, and AAW04831), which promote endothelial or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and tissue regeneration/recognistion. The VEGF proteins of the invention share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins of nitibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect of the invention can also be used to detect VEGF-B coding sequences. Ountification of VEGF-B in cancer biopsy specimens may be useful as an infinite of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Endothelial cell; proliferation; vascular endothelial growth factor; VPF; vBGF; endothelium; mesodermal cell; cationic dimer; tissue regeneration; vascular permeability factor; cell mitogen; anglogenesis; cell growth; embryonic development; wound healing; tissue reorganisation; antibody; cancer; metastatic risk; tumour cell; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Factor VIII analogue is sufficiently mutated from the original gene that it is not recognised by blood Abs of the patient. The analogue is composed of human FVIII but carries the B-domain of human FV in place of the FVIII B-domain.

Oligonucleotides can be used to alter the profile of the blood factor without significantly altering its activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

AAT37933-T37946 represent the intron/exon boundaries for the human vascular endothelial growth factor (VEGF) proteins of the invention (see AAW04829, and AAW0481), which promote endothelial or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the special collogical context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound challing, and tissue regeneration/reorganisation. The VEGF proteins of the invention share the angiogenet and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate adjoigenesis in wound healing. The antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF-B. Primers complementary to the coding sequences. Countification of VEGF-B in cancer blopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF expression in tumour cells.
                                                                                                                                                                                                            Vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic acid and antibodies for cancer diagnosis
                                                                                                                 Alitalo K, Eriksson U, Olofsson B, Pajusola K;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 486, Application US/08171389

Patent No. 5578444

GENERAL INFORMATION:

APPLICANT: Edwards, Cynthia A.

APPLICANT: Andrews, Beth M.

APPLICANT: Turin, Lisa M.

TITLE OF INVENTION: Sequence-Directed DNA Binding

TITLE OF INVENTION: Molecules, Compositions and Methods

WUMBER OF SEQUENCES: 641

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 80.0%; Score 12; DB 3; Length 29, 100.0%; Pred. No. 4.3e+02;

Sequence 487, Application US/08482080A
Patent No. 6010849
GENERAL INFORMATION:
APPLICANT: Edwards, Cynthia A.
APPLICANT: Cantor, Charles R.
APPLICANT: Turin, Lisa M.
APPLICANT: Fry, Kirk E.
TITLE OF INVENTION: Molecules, Compositions and Methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CURRENT APPLICATION DATA:

                                                                                                                                                                                                                                                                                                                                              ö
                                          The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion Kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a number of phosphorothicate antisense sequences to the human focal adhesion kinase (FAK) protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primers AAX36327-28 were used to amplify human FAK cDNA, in the course of the invention. The specification describes a method for altering the tumorigenicity or malignancy of brain cancer cells by changing the activity of glycosyltransferase in the cell so that glycosylation of cellular proteins is modified. The method is applied to glicom or meningiona, for prevention or treatment of brain tumours. Measuring the level of glycosyltransferase expression in brain cells is used to detect or predict their tumorigenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
fibrononectin collagen-binding domain. The amplified sequence was used to construct a collagen-binding physiologically active polypeptide. This polypeptide comprises a peptide from fibronectin ligated to a physiologically active peptide. The polypeptides are used in an agent for enabling topical retention or sustained release of a physiological active peptide active peptide or physiological activity-imparting agent. They may be used in gene therapy and in tissue regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This primer is used for the PCR amplification of guanosine 5-diphospho

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assass the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PBA) dosage. However, the effectiveness of this is limited due to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the cuture, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0

beta L-fucose (GDP-fucose) pyrophosphorylase (GDPFPP) cDNA. Cells can be genetically engineered to contain the GDPFPP nucleic acids and produce the protein. GDPFPP enzymes can be used to synthesise carbohydrate molecules of defined structures, useful in investigating the role of carbohydrates as recognition elements on cell surfaces. They are especially useful in producing donor substrates (e.g. GDP-fucose) in reactions of a glycosyl transferase (e.g. fucosyltransferase) with the substrate, an acceptor sugar and a divalent metal cation to allow formation of glycosylic linkages adding a saccharide to a substrate saccharide. The proteins can also be used to produce antibodies or antisera useful to characterise, detect and isolate proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A 5' primer (AAT997584) and a 3' primer (AAT997585) were used in the PCR amplification of human GDP-fucose pyrophosphorylase (GDPFPP) cDNA (see AAT97583) from Epstein-Barr virus-transformed B lymphoblastoid cell line JY, and were designed to incorporate EcoRV sites at the 5' and 3' termin of the amplified sequence. The amplified GDPFPP CDNA was subsequently incorporated into expression vectors. Recombinant human GDPFPP was expressed in COS, NSO and Spodoptera frugiperda Sf9 cells. The claimed enzyme (see AAW36811) is useful in the synthesis of carbohydrate structures.
                                                                                                                                                                                                              cross-reacting with the GDPFPP protein.
Note: The specification refers to claimed GDPFPP nucleotide and amino acid sequences, neither of which are given in the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensize, parternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.
                                                                                                                                                                                                                                                                                                    Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; flms-like tyrosine kinase 1; kinase insert domain containing receptor;

```
This represents a promoter fragment of the HIV-1 genome that is used as a target sequence. The invention provides polyamide DNA-binding ligands for modulating expression of cellular and viral genes. One method comprises identifying a unique target DNA sequence adjacent to the binding site of a minor groove transcription factor protein (MGTFP), choosing a polyamide having subnanomolar affinity for the target DNA and treating the target DNA with the polyamide as transcription inhibiting replication of a pathogen by administering a transcription-inhibiting replication of a pathogen by administering a transcription-inhibiting replication of a pathogen by replacing a transcription-inhibiting polyamide; (2) improving binding affinity of polyamide, selected for an identified viral DNA target by replacing a carboxamide binding pair (CBP) that does not include N-methylimidazole carboxamide (IM) with a CBP comprising paired beta-alanine (beta) residues; (3) inhibiting binding of the zinc finger protein TFIIIA to

ö
the SS ribosomal RNA gene internal control region; (4) for treating adenocarcinoma of ovary, endometrium, breast, fallopian tubes and cervix with the polyamide are also provided. Method (1) is applied to viruses, bacteria, fungi and protozoa, especially human immune deficiency virus (HIV)-1, both therapeutically and for treating blood cells in vitro. Method (4) is especially used against cancers that overexpress the her-2,new oncogene. The polyamide can also be used for diagnosis of disease, very generally as therapeutic agents for any disease involving cellular or viral gene transcription, for genomic sequencing, for DNA capture and for DNA cleavage (oxidative or by light). The polyamide has excellent specificity and very high affinity for the target DNA, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TATA modulating factor, TMF; transcription; TATA box; promoter; HIV-1; human immunodeficiency virus-1; short arm; human chromosome 3; p12-p21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the TATA region of the HIV-1 LTR from -46 to -1. This region is bound by TATA modulating factor (TMF). TMF is a protein of mol. wt. 123-130 kD which activates transcription in most genes, esp. in human immundeficiency virus-1 (HIV-1) by binding to the TATA box region of the promoter. TMF is encoded by the short arm of human chromosome 3 in the region p12-p21 which is often involved in translocations in patients having lung and other types

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     One application of this method is to eucaryotic general transcription factors (e.g. TFIID), where the target region is typically selected from DNA sequences adjacent to the binding site for the eucaryotic transcription factor. Numerous exemplary test sequences are given: the sequences in AAQ69851-731 and AAQ6980 correspond to promoter targets (typically, TATA box-contg. sites) for human genes and the sequences in AAQ69732-849 correspond to promoter targets for viral genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The test sequences may also be randomly generated. DNA:protein interaction may be used for screening purposes, e.g. the Herpes Simplex Virus (HSV) origin of replication and UL9 (see AAQ69851-52, AAQ69865 and AAQ69891).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A DNA protein-binding assay is provided, useful for screening libraries of synthetic or biological cpds. for their ability to bind DNA test sequences. The assay is versatile in that any number of test sequences can be tested by placing the test sequence adjacent to a defined protein-binding screening sequence. Binding of mols. to these test sequences changes the binding characteristics of the protein mol. to its cognate binding sequence. When such a binds the test sequence, the equilibrium of the DNA:protein complexes is disturbed, generating changes in the concentration of free DNA probe.

                                                                        factors (e.g. TFIID), where the target region is typically selected from DNA sequences adjacent to the binding site for the eucaryotic transcription factor. Numerous exemplary test sequences are given: the sequences in AAO69251-731 and AAO69850 correspond to promoter targets (typically, TATA box-contg. sites) for human genes and the sequences in AAO69732-849 correspond to promoter targets for viral genes. The test sequences may also be randomly generated. DNA:protein interaction may be used for screening purposes, e.g. the Herpes Simplex Virus (HSV) origin of replication and UL9 (see AAO69851-52, AAO69865 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A DNA protein-binding assay is provided, useful for screening libraries of synthetic or biological cpds. for their ability to bind DNA test sequences. The assay is versatile in that any number of test sequences can be tested by placing the test sequence adjacent to a defined protein binding screening sequence. Binding of mols. to these test sequences changes the binding characteristics of the protein mol. to its cognate binding sequence. When such a mol. binds the test sequence, the equilibrium of the DNA.protein complexes is disturbed, generating changes in the concentration of free DNA probe. One application of this method is to eucaryotic general transcription

The sequences given in AAT63713-4312 represent duplex DNA's which act as target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA comprises contacting the duplex DNA with a small molecule which binds sequence-specifically to a target region, where, when the small collection is bound to the target region, it is adjacent to, but not conclapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding site on the duplex DNA. The binding of the small molecule may inhibit or compounds isolated using this method are potentially useful as the method is suitable for trement of any disease which involves a specific DNA sequence, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences. The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific or preferential, DNA binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to be used for screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also AAT49539-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 50;

```
as target regions in Anion 19713-1912 represent dupter DNA succes as target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA somprises contexting the duptex DNA with a small molecule which binds sequence-specifically to a target region, where, when the small molecule is bound to the target region, it is adjacent to, but not overlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding of the Small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site. The compounds isolated using this method are potentially useful as therapeutic agents for treatment of any disease which involves a specific DNA sequence, e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences.

The design of these duplex DNA's allows a single DNA-brotein interaction to be used for screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also AAT49539-
                                                                                                                                                                                               Duplex DNA; target region: binding characteristic; DNA binding protein; TFIID; transcription factor; binding site; inhibition; enhance; cancer; inherited genetic disorder; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAT63713-4312 represent duplex DNA's which act
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Altering binding characteristics of DNA binding proteins to duplex DNA - by attaching specific small cpd. to target region close to the protein's binding site, useful in treatment of viral disease, cancer
                                                                                                                                                           Aids-associated retrovirus proviral arv2 TFIID binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 31;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 11, Application US/08732612
Patent No. 5922583
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: MORSEY, MOHAMAD A.
TITLE OF INVENTION: METHODS FOR PRODUCTION OF RECOMBINANT
TITLE OF INVENTION: PLASMIDS
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: MORRISON & FOERSTER
STREET: 2000 PENNSYLVANIA AVE., NW
CITY: WASHINGTON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
FILING DATE: 16-OCT-1996
CLASSIFICATION: 435
